Gene Name: oxidized low density lipoprotein receptor 1

Database Link: Entrez Gene 4973 Human

P78380

Background: This gene encodes a low density lipoprotein receptor that belongs to the C-type lectin

superfamily. This gene is regulated through the cyclic AMP signaling pathway. The encoded protein binds, internalizes and degrades oxidized low-density lipoprotein. This protein may be involved in the regulation of Fas-induced apoptosis. This protein may play a role as a scavenger receptor. Mutations of this gene have been associated with atherosclerosis, risk of myocardial infarction, and may modify the risk of Alzheimer's disease. Alternate splicing

results in multiple transcript variants.
