Background:	This gene encodes a protein belonging to the sprouty family. The encoded protein contains a carboxyl-terminal cysteine-rich domain essential for the inhibitory activity on receptor tyrosine kinase signaling proteins and is required for growth factor stimulated translocation of the protein to membrane ruffles. In primary dermal endothelial cells this gene is

transiently upregulated in response to fibroblast growth factor two. This protein is indirectly

receptor/mitogen-activated protein kinase signaling. This protein may play a role in alveoli

involved in the non-cell autonomous inhibitory effect on fibroblast growth factor two signaling. The protein interacts with Cas-Br-M (murine) ectropic retroviral transforming

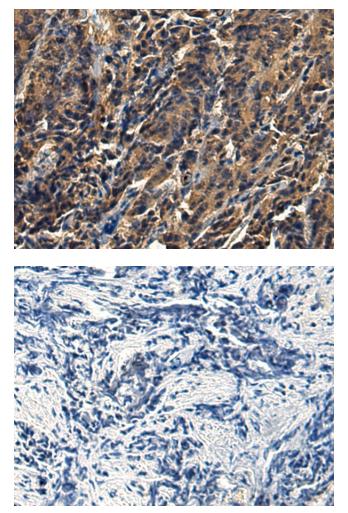

sequence, and can function as a bimodal regulator of epidermal growth factor

branching during lung development as shown by a similar mouse protein.
