DDX23 Rabbit Polyclonal Antibody – TA365736

Background:This gene encodes a member of the DEAD box protein family. DEAD box proteins,
characterized by the conserved motif Asp-Glu-Ala-Asp (DEAD), are putative RNA helicases.
They are implicated in a number of cellular processes involving alteration of RNA secondary
structure, such as translation initiation, nuclear and mitochondrial splicing, and ribosome
and spliceosome assembly. Based on their distribution patterns, some members of this
family are believed to be involved in embryogenesis, spermatogenesis, and cellular growth
and division. The protein encoded by this gene is a component of the U5 snRNP complex; it
may facilitate conformational changes in the spliceosome during nuclear pre-mRNA splicing.
An alternatively spliced transcript variant has been found for this gene, but its biological
validity has not been determined.
