GRIGENE RPL13A Rabbit Polyclonal Antibody – TA366158

Background:Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and
a large 60S subunit. Together these subunits are composed of 4 RNA species and
approximately 80 structurally distinct proteins. This gene encodes a member of the L13P
family of ribosomal proteins that is a component of the 60S subunit. The encoded protein
also plays a role in the repression of inflammatory genes as a component of the IFN-gamma-
activated inhibitor of translation (GAIT) complex. This gene is co-transcribed with the small
nucleolar RNA genes U32, U33, U34, and U35, which are located in the second, fourth, fifth,
and sixth introns, respectively. As is typical for genes encoding ribosomal proteins, there are
multiple processed pseudogenes of this gene dispersed throughout the genome.
Alternatively spliced transcript variants encoding multiple isoforms have been observed for
this gene.
