Background: Phosphatidylinositol 3-kinase phosphorylates the inositol ring of phosphatidylinositol at the

3-prime position. The enzyme comprises a 110 kD catalytic subunit and a regulatory subunit

of either 85, 55, or 50 kD. This gene encodes the 85 kD regulatory subunit.

Phosphatidylinositol 3-kinase plays an important role in the metabolic actions of insulin, and a mutation in this gene has been associated with insulin resistance. Alternative splicing of this

gene results in four transcript variants encoding different isoforms.

Synonyms: GRB1; p85; p85-ALPHA; PI3K
