**Background:** This gene encodes a cytoplasmic linker or adaptor protein that plays a critical role in B cell

development. This protein bridges B cell receptor-associated kinase activation with downstream signaling pathways, thereby affecting various biological functions. The phosphorylation of five tyrosine residues is necessary for this protein to nucleate distinct signaling effectors following B cell receptor activation. Mutations in this gene cause hypoglobulinemia and absent B cells, a disease in which the pro- to pre-B-cell transition is

developmentally blocked. Deficiency in this protein has also been shown in some cases of

pre-B acute lymphoblastic leukemia.
