GRIGENE TGF beta 2 (TGFB2) Rabbit Polyclonal Antibody – TA367309

Background:This gene encodes a member of the transforming growth factor beta (TGFB) family of
cytokines, which are multifunctional peptides that regulate proliferation, differentiation,
adhesion, migration, and other functions in many cell types by transducing their signal
through combinations of transmembrane type I and type II receptors (TGFBR1 and TGFBR2)
and their downstream effectors, the SMAD proteins. Disruption of the TGFB/SMAD pathway
has been implicated in a variety of human cancers. The encoded protein is secreted and has
suppressive effects of interleukin-2 dependent T-cell growth. Translocation t(1;7)(q41;p21)
between this gene and HDAC9 is associated with Peters' anomaly, a congenital defect of the
anterior chamber of the eye. The knockout mice lacking this gene show perinatal mortality
and a wide range of developmental, including cardiac, defects. Alternatively spliced transcript
variants encoding different isoforms have been identified.
