Background: The protein encoded by this gene belongs to the ARF family of GTP-binding proteins. With its

distinctive nuclear/nucleolar localization and interaction with HP1alpha, the protein is developmentally regulated and may play a role(s) in nuclear dynamics and/or signaling cascades during embryonic development. Alternative splicing results in multiple transcript

variants encoding different isoforms. This gene has multiple pseudogenes.

Synonyms: ARFLP5; ARL5; OTTHUMP00000207221
