**Background:** The protein encoded by this gene is a secreted cytokine that is important for the proliferation

of T and B lymphocytes. The receptor of this cytokine is a heterotrimeric protein complex whose gamma chain is also shared by interleukin 4 (IL4) and interleukin 7 (IL7). The expression of this gene in mature thymocytes is monoallelic, which represents an unusual regulatory mode for controlling the precise expression of a single gene. The targeted

disruption of a similar gene in mice leads to ulcerative colitis-like disease, which suggests an

essential role of this gene in the immune response to antigenic stimuli.

Synonyms: aldesleukin; IL-2; interleukin-2; lymphokine; TCGF
