**Background:** Glycophorin C (GYPC) is an integral membrane glycoprotein. It is a minor species carried by

human erythrocytes, but plays an important role in regulating the mechanical stability of red cells. A number of glycophorin C mutations have been described. The Gerbich and Yus phenotypes are due to deletion of exon 3 and 2, respectively. The Webb and Duch antigens,

also known as glycophorin D, result from single point mutations of the glycophorin C gene. The glycophorin C protein has very little homology with glycophorins A and B. Alternate

splicing results in multiple transcript variants.

**Synonyms:** CD236; CD236R; GE; GLPC; Glycoconnectin; Glycophorin-D; GPC; GPD; GYPD; MGC117309;
