Background: This gene encodes a member of the immunoglobulin LAMP, OBCAM and neurotrimin (IgLON)

family of proteins. The encoded preproprotein is proteolytically processed to generate a neuronal surface glycoprotein. This protein may act as a selective homophilic adhesion molecule during axon guidance and neuronal growth in the developing limbic system. The

encoded protein may also function as a tumor suppressor and may play a role in

neuropsychiatric disorders. Alternative splicing results in multiple transcript variants, at least

one of which encodes a preproprotein that is proteolytically processed.
