Background: The protein encoded by this gene is a member of the Ras superfamily of guanosine

triphosphate (GTP)-metabolizing enzymes. The encoded protein is expressed in

hematopoietic cells, where it functions as a negative regulator of cell growth and survival.

This gene may be hypermutated or misexpressed in leukemias and lymphomas.

Chromosomal translocations in non-Hodgkin's lymphoma occur between this locus and B-cell CLL/lymphoma 6 (BCL6) on chromosome 3, leading to the production of fusion transcripts. Alternative splicing in the 5' untranslated region results in multiple transcript variants that

encode the same protein.
