Background:	This gene encodes the penultimate enzyme of heme biosynthesis, which catalyzes the 6- electron oxidation of protoporphyrinogen IX to form protoporphyrin IX. Mutations in this gene cause variegate porphyria, an autosomal dominant disorder of heme metabolism resulting from a deficiency in protoporphyrinogen oxidase, an enzyme located on the inner mitochondrial membrane. Alternatively spliced transcript variants encoding the same protein have been identified.
Synonyms:	MGC8485; PPO; V290M; VP
