PORIGENE RPL13 Rabbit Polyclonal Antibody – TA370514S

Background:Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and
a large 60S subunit. Together these subunits are composed of 4 RNA species and
approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is
a component of the 60S subunit. The protein belongs to the L13E family of ribosomal
proteins. It is located in the cytoplasm. This gene is expressed at significantly higher levels in
benign breast lesions than in breast carcinomas. Alternatively spliced transcript variants
encoding distinct isoforms have been found for this gene. As is typical for genes encoding
ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed
through the genome.
