Background: The protein encoded by this gene is a transcription factor required for the expression of

> several liver-specific genes. The encoded protein functions as a homodimer and binds to the inverted palindrome 5'-GTTAATNATTAAC-3'. Defects in this gene are a cause of maturity onset diabetes of the young type 3 (MODY3) and also can result in the appearance of hepatic adenomas. Alternative splicing results in multiple transcript variants encoding different

isoforms.

Synonyms: HNF-1A; HNF1; LFB1; MODY3; TCF-1; TCF1
