Gene Name:	oxidized low density lipoprotein receptor 1
Database Link:	Entrez Gene 4973 Human P78380
Background:	This gene encodes a low density lipoprotein receptor that belongs to the C-type lectin superfamily. This gene is regulated through the cyclic AMP signaling pathway. The encoded protein binds, internalizes and degrades oxidized low-density lipoprotein. This protein may be involved in the regulation of Fas-induced apoptosis. This protein may play a role as a scavenger receptor. Mutations of this gene have been associated with atherosclerosis, risk of myocardial infarction, and may modify the risk of Alzheimer's disease. Alternate splicing results in multiple transcript variants.
Synonyms:	CLEC8A; hLOX-1; LOX-1; LOX1; SCARE1
