CAB39 Rabbit Polyclonal Antibody – TA371430

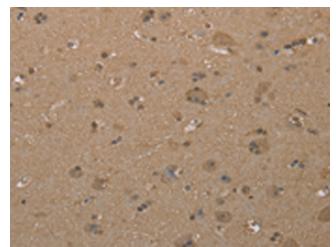

Background:Peutz-Jeghers Syndrome (PJS) is a rare hereditary disease characterized by melanocytic
macules of the lips, gastrointestinal hamartomatous polyps and an increased risk for many
classes of cancer. The serine/threonine kinase LKB1 (also designated STK11) has been
identified as the gene mutated in PJS. LKB1 activity increases upon the binding of a regulatory
complex consisting of the STE20-related adaptor-alpha (STRAD alpha) pseudo kinase and the
calcium binding protein 39 (MO25 alpha). STRAD and MO25 determine the subcellular
localization of LKB1 by initiating its translocation from the nucleus to the cytoplasm, thus
regulating the tumor suppressor activity of LKB1. The LKB1/STRAD/MO25 complex acts as an
AMP-activated protein kinase kinase (AMPKK).

Synonyms: CGI-66; FLJ22682; MO25
