Background: This gene is a member of the myosin gene family. Myosins are mechanochemical proteins

characterized by the presence of a motor domain, an actin-binding domain, a neck domain that interacts with other proteins, and a tail domain that serves as an anchor. This gene encodes an unconventional myosin with a very short tail. Defects in this gene are associated

with the mouse shaker-1 phenotype and the human Usher syndrome 1B which are

characterized by deafness, reduced vestibular function, and (in human) retinal degeneration.

Alternative splicing results in multiple transcript variants.
