Background:	The protein encoded by this gene is thought to be a transcriptional corepressor. However, molecules that interact with this protein have not yet been identified. The protein is a member of the tripartite motif family. This motif includes three zinc-binding domains, a RING, a B-box type 1 and a B-box type 2, and a coiled-coil region. Three alternatively spliced transcript variants for this gene have been described, however, the full-length nature of one variant has not been determined.
Synonyms:	FLJ11429; FLJ32925; KIAA1113; PTC7; RFG7; TF1G; TIF1-gamma; TIF1G; TIF1GAMMA; TIFGAMMA
