Background: This gene encodes a member of the tripartite motif (TRIM) family. The TRIM motif includes

three zinc-binding domains, a RING, a B-box type 1 and a B-box type 2, and a coiled-coil region. This protein localizes to the nuclear matrix. It interacts with the enhancer of polycomb

protein and represses gene transcription. It is also thought to be involved in the

differentiation of male germ cells. Fusion of the N-terminus of this protein with the truncated

C-terminus of the RET gene product has been shown to result in production of the ret

transforming protein.
