Q16666

Background: This gene encodes a member of the HIN-200 (hematopoietic interferon-inducible nuclear

antigens with 200 amino acid repeats) family of cytokines. The encoded protein contains

domains involved in DNA binding, transcriptional regulation, and protein-protein

interactions. The protein localizes to the nucleoplasm and nucleoli, and interacts with p53 and retinoblastoma-1. It modulates p53 function, and inhibits cell growth in the Ras/Raf signaling pathway. Alternatively spliced transcript variants encoding different isoforms have

been found for this gene.

Synonyms: IFNGIP1; MGC9466; PYHIN2
