**Background:** The protein encoded by this gene belongs to a family of bifunctional proteins that are

involved in both the synthesis and degradation of fructose-2,6-bisphosphate, a regulatory molecule that controls glycolysis in eukaryotes. The encoded protein has a 6-phosphofructo-2-kinase activity that catalyzes the synthesis of fructose-2,6-bisphosphate (F2,6BP), and a fructose-2,6-biphosphatase activity that catalyzes the degradation of F2,6BP. This protein is required for cell cycle progression and prevention of apoptosis. It functions as a regulator of cyclin-dependent kinase 1, linking glucose metabolism to cell proliferation and survival in tumor cells. Several alternatively spliced transcript variants of this gene have been described,

but the full-length nature of some of these variants has not been determined.

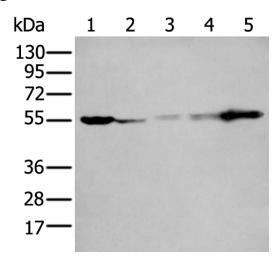

Synonyms:

6-phosphofructo-2-kinase/fructose-2,6-biphosphatas; FLJ37326; iPFK-2; IPFK2; PFK2
