GRIGENE FUT3 Rabbit Polyclonal Antibody – TA372589

Background:The Lewis histo-blood group system comprises a set of fucosylated glycosphingolipids that
are synthesized by exocrine epithelial cells and circulate in body fluids. The
glycosphingolipids function in embryogenesis, tissue differentiation, tumor metastasis,
inflammation, and bacterial adhesion. They are secondarily absorbed to red blood cells giving
rise to their Lewis phenotype. This gene is a member of the fucosyltransferase family, which
catalyzes the addition of fucose to precursor polysaccharides in the last step of Lewis antigen
biosynthesis. It encodes an enzyme with alpha(1,3)-fucosyltransferase and alpha(1,4)-
fucosyltransferase activities. Mutations in this gene are responsible for the majority of Lewis
antigen-negative phenotypes. Multiple alternatively spliced variants, encoding the same
protein, have been found for this gene.

Synonyms:

alpha-(1,3/1,4)-fucosyltransferase; CD174; FT3B; FucT-III; LE; Les; MGC131739
