Gene Name:	glutamate ionotropic receptor kainate type subunit 5
Database Link:	Entrez Gene 2901 Human Q16478
Background:	This gene encodes a protein that belongs to the glutamate-gated ionic channel family. Glutamate functions as the major excitatory neurotransmitter in the central nervous system through activation of ligand-gated ion channels and G protein-coupled membrane receptors. The protein encoded by this gene forms functional heteromeric kainate-preferring ionic channels with the subunits encoded by related gene family members. Alternative splicing results in multiple transcript variants.
Synonyms:	EAA2; GRIK2; KA2
