#### **GRIGENE** KIR2DL5A Rabbit Polyclonal Antibody – TA372859S

Background:Killer cell immunoglobulin-like receptors (KIRs) are transmembrane glycoproteins expressed<br/>by natural killer cells and subsets of T cells. The KIR genes are polymorphic and highly<br/>homologous and they are found in a cluster on chromosome 19q13.4 within the 1 Mb<br/>leukocyte receptor complex (LRC). The gene content of the KIR gene cluster varies among<br/>haplotypes, although several framework genes are found in all haplotypes (KIR3DL3, KIR3DP1,<br/>KIR3DL4, KIR3DL2). The KIR proteins are classified by the number of extracellular<br/>immunoglobulin domains (2D or 3D) and by whether they have a long (L) or short (S)<br/>cytoplasmic domain. KIR proteins with the long cytoplasmic domain transduce inhibitory<br/>signals upon ligand binding via an immune tyrosine-based inhibitory motif (ITIM), while KIR<br/>proteins with the short cytoplasmic domain lack the ITIM motif and instead associate with the<br/>TYRO protein tyrosine kinase binding protein to transduce activating signals. The ligands for<br/>several KIR proteins are subsets of HLA class I molecules; thus, KIR proteins are thought to<br/>play an important role in regulation of the immune response.
