**Background:** This gene encodes a serine protease. The protein has been localized in the endoplasmic

reticulum and interacts with an alternatively spliced form of mitogen-activated protein kinase

14. The protein has also been localized to the mitochondria with release to the cytosol following apoptotic stimulus. The protein is thought to induce apoptosis by binding the apoptosis inhibitory protein baculoviral IAP repeat-containing 4. Nuclear localization of this protein has also been observed. Alternate splicing of this gene results in multiple transcript

variants encoding different isoforms.

Synonyms: OMI; PARK13; PRSS25
