Background:	The protein encoded by this gene is a member of the glucuronyltransferase gene family. These enzymes exhibit strict acceptor specificity, recognizing nonreducing terminal sugars and their anomeric linkages. This gene product functions as the key enzyme in a glucuronyl transfer reaction during the biosynthesis of the carbohydrate epitope HNK-1 (human natural killer-1, also known as CD57 and LEU7). Alternate transcriptional splice variants have been characterized.
Synonyms:	CD57; GlcAT-P; GLCATP; GlcUAT-P; GLCUATP; Glucuronosyltransferase-P; HNK-1; HNK1; LEU7; NK-1; NK1
