GRIGENE FTS (AKTIP) Rabbit Polyclonal Antibody – TA373427

Background:The mouse homolog of this gene produces fused toes and thymic hyperplasia in
heterozygous mutant animals while homozygous mutants die in early development. This
gene may play a role in apoptosis as these morphological abnormalities are caused by
altered patterns of programmed cell death. The protein encoded by this gene is similar to the
ubiquitin ligase domain of other ubiquitin-conjugating enzymes but lacks the conserved
cysteine residue that enables those enzymes to conjugate ubiquitin to the target protein. This
protein interacts directly with serine/threonine kinase protein kinase B (PKB)/Akt and
modulates PKB activity by enhancing the phosphorylation of PKB's regulatory sites.
Alternative splicing results in two transcript variants encoding the same protein.
