Gene Name: angiomotin

Database Link: Q4VCS5

**Background:** This gene belongs to the motin family of angiostatin binding proteins characterized by

conserved coiled-coil domains and C-terminal PDZ binding motifs. The encoded protein is expressed predominantly in endothelial cells of capillaries as well as larger vessels of the placenta where it may mediate the inhibitory effect of angiostatin on tube formation and the migration of endothelial cells toward growth factors during the formation of new blood

 $vessels.\ Alternative\ splicing\ results\ in\ multiple\ transcript\ variants\ encoding\ different\ is oforms.$ 

**Synonyms:** angiomotin; KIAA1071
