Background: This gene encodes a component of the polycomb multiprotein complex, which is required to

> maintain the transcriptionally repressive state of many genes throughout development via chromatin remodeling and modification of histones. Disruption of this gene in mice results in male-to-female gonadal sex reversal. Mutations in this gene are also associated with gonadal dysgenesis in humans. Alternatively spliced transcript variants encoding different isoforms

have been noted for this gene.

Synonyms: CDCA6; M33; MGC10561
