in co prot and (CD	s gene encodes a member of a family of serine/threonine protein kinases that participate cell cycle regulation. The encoded protein is the catalytic subunit of the cyclin-dependent otein kinase complex, which regulates progression through the cell cycle. Activity of this otein is especially critical during the G1 to S phase transition. This protein associates with d regulated by other subunits of the complex including cyclin A or E, CDK inhibitor p21Cip1 0KN1A), and p27Kip1 (CDKN1B). Alternative splicing results in multiple transcript variants.
Synonyms: p33	3(CDK2)
