**Background:** The muscarinic cholinergic receptors belong to a larger family of G protein-coupled receptors.

The functional diversity of these receptors is defined by the binding of acetylcholine and

includes cellular responses such as adenylate cyclase inhibition, phosphoinositide degeneration, and potassium channel mediation. Muscarinic receptors influence many effects of acetylcholine in the central and peripheral nervous system. The muscarinic cholinergic receptor 3 controls smooth muscle contraction and its stimulation causes

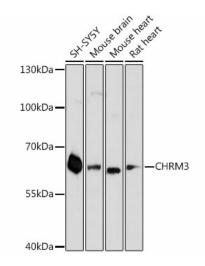

secretion of glandular tissue.

Synonyms: HM3
