Gene Name: cholinergic receptor nicotinic alpha 3 subunit

Database Link: Entrez Gene 1136 Human

P32297

Background: This locus encodes a member of the nicotinic acetylcholine receptor family of proteins.

> Members of this family of proteins form pentameric complexes comprised of both alpha and beta subunits. This locus encodes an alpha-type subunit, as it contains characteristic adjacent cysteine residues. The encoded protein is a ligand-gated ion channel that likely plays a role in neurotransmission. Polymorphisms in this gene have been associated with an increased risk of smoking initiation and an increased susceptibility to lung cancer. Alternatively spliced

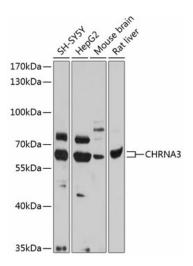

transcript variants have been described.

Synonyms: LNCR2; MGC104879; NACHRA3; PAOD2
