CNTF Rabbit Polyclonal Antibody – TA374934

Background:The protein encoded by this gene is a polypeptide hormone whose actions appear to be
restricted to the nervous system where it promotes neurotransmitter synthesis and neurite
outgrowth in certain neuronal populations. The protein is a potent survival factor for neurons
and oligodendrocytes and may be relevant in reducing tissue destruction during
inflammatory attacks. A mutation in this gene, which results in aberrant splicing, leads to
ciliary neurotrophic factor deficiency, but this phenotype is not causally related to neurologic
disease. A read-through transcript variant composed of the upstream ZFP91 gene and CNTF
sequence has been identified, but it is thought to be non-coding. Read-through transcription
of ZFP91 and CNTF has also been observed in mouse.
