Background: This gene encodes a member of the beta/gamma-crystallin family of proteins. Crystallins

constitute the major proteins of vertebrate eye lens and maintain the transparency and refractive index of the lens. This gene and several family members are present in a gene cluster on chromosome 2. Mutations in this gene have been shown to cause multiple types of cataract, including Coppock-like cataract and zonular pulverulent cataract, among others.

Synonyms: CCL; CRYG3; Gamma-C-crystallin
