GRIGENE DAZL Rabbit Polyclonal Antibody – TA375331

Background:The DAZ (Deleted in AZoospermia) gene family encodes potential RNA binding proteins that
are expressed in prenatal and postnatal germ cells of males and females. The protein
encoded by this gene is localized to the nucleus and cytoplasm of fetal germ cells and to the
cytoplasm of developing oocytes. In the testis, this protein is localized to the nucleus of
spermatogonia but relocates to the cytoplasm during meiosis where it persists in spermatids
and spermatozoa. Transposition and amplification of this autosomal gene during primate
evolution gave rise to the DAZ gene cluster on the Y chromosome. Mutations in this gene
have been linked to severe spermatogenic failure and infertility in males. Two transcript
variants encoding different isoforms have been found for this gene.

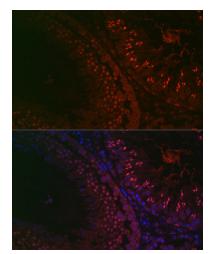

Synonyms:

DAZH; DAZL1; DAZLA; MGC26406; SPGY-like-autosomal; SPGYLA
