Gene Name:	dynein axonemal heavy chain 5
Database Link:	Q8TE73
Background:	This gene encodes a dynein protein, which is part of a microtubule-associated motor protein complex consisting of heavy, light, and intermediate chains. This protein is an axonemal heavy chain dynein. It functions as a force-generating protein with ATPase activity, whereby the release of ADP is thought to produce the force-producing power stroke. Mutations in this gene cause primary ciliary dyskinesia type 3, as well as Kartagener syndrome, which are both diseases due to ciliary defects. [provided by RefSeq, Oct 2009]
Synonyms:	CILD3; DNAHC5; FLJ46759; HL1; KIAA1603; KTGNR; PCD
