### **GRIGENE** DUT Rabbit Polyclonal Antibody – TA375661

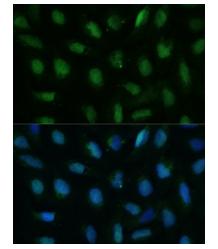

Background:This gene encodes an essential enzyme of nucleotide metabolism. The encoded protein<br/>forms a ubiquitous, homotetrameric enzyme that hydrolyzes dUTP to dUMP and<br/>pyrophosphate. This reaction serves two cellular purposes: providing a precursor (dUMP) for<br/>the synthesis of thymine nucleotides needed for DNA replication, and limiting intracellular<br/>pools of dUTP. Elevated levels of dUTP lead to increased incorporation of uracil into DNA,<br/>which induces extensive excision repair mediated by uracil glycosylase. This repair process,<br/>resulting in the removal and reincorporation of dUTP, is self-defeating and leads to DNA<br/>fragmentation and cell death. Alternative splicing of this gene leads to different isoforms that<br/>localize to either the mitochondrion or nucleus. A related pseudogene is located on<br/>chromosome 19.

Synonyms: dUTPase; FLJ20622
