P62495

**Background:** This gene encodes a class-1 polypeptide chain release factor. The encoded protein plays an

essential role in directing termination of mRNA translation from the termination codons UAA,

UAG and UGA. This protein is a component of the SURF complex which promotes

degradation of prematurely terminated mRNAs via the mechanism of nonsense-mediated mRNA decay (NMD). Alternate splicing results in multiple transcript variants. Pseudogenes of

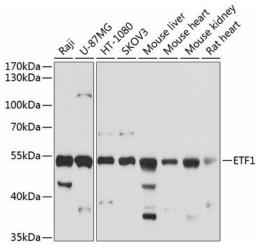

this gene are found on chromosomes 6, 7, and X.

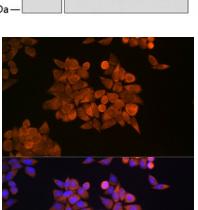

**Synonyms:** D5S1995; ERF; ERF1; MGC111066; RF1; SUP45L1; TB3-1
