GRIGENE FGF9 Rabbit Polyclonal Antibody – TA376234S

Background:The protein encoded by this gene is a member of the fibroblast growth factor (FGF) family.
FGF family members possess broad mitogenic and cell survival activities, and are involved in
a variety of biological processes, including embryonic development, cell growth,
morphogenesis, tissue repair, tumor growth and invasion. This protein was isolated as a
secreted factor that exhibits a growth-stimulating effect on cultured glial cells. In nervous
system, this protein is produced mainly by neurons and may be important for glial cell
development. Expression of the mouse homolog of this gene was found to be dependent on
Sonic hedgehog (Shh) signaling. Mice lacking the homolog gene displayed a male-to-female
sex reversal phenotype, which suggested a role in testicular embryogenesis.

Synonyms: FGF-9; GAF; HBFG-9; HBGF-9; MGC119914; MGC119915; SYNS3
