Q9HA64

**Background:** A high concentration of glucose can result in non-enzymatic oxidation of proteins by reaction

of glucose and lysine residues (glycation). Proteins modified in this way are less active or

functional. This gene encodes an enzyme which catalyzes the phosphorylation of

psicosamines and ribulosamines compared to the neighboring gene which encodes a highly similar enzyme, fructosamine-3-kinase, which has different substrate specificity. The activity of both enzymes may result in deglycation of proteins to restore their function. Alternative

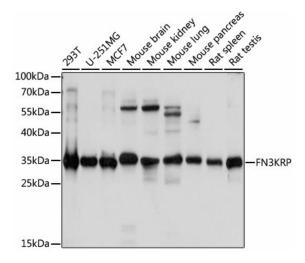

splicing results in multiple transcript variants.

**Synonyms:** FLJ12171; FN3K-RP; FN3KL
