Background: Cell surface heparan sulfate proteoglycans are composed of a membrane-associated protein

> core substituted with a variable number of heparan sulfate chains. Members of the glypicanrelated integral membrane proteoglycan family (GRIPS) contain a core protein anchored to the cytoplasmic membrane via a glycosyl phosphatidylinositol linkage. These proteins may play a role in the control of cell division and growth regulation. The GPC4 gene is adjacent to

the 3' end of GPC3 and may also play a role in Simpson-Golabi-Behmel syndrome.

Synonyms: K-glypican
