#### Section 2017 Contemporary Conte

Background:Histones are basic nuclear proteins responsible for nucleosome structure of the<br/>chromosomal fiber in eukaryotes. Two molecules of each of the four core histones (H2A,<br/>H2B, H3, and H4) form an octamer, around which approximately 146 bp of DNA is wrapped<br/>in repeating units, called nucleosomes. The linker histone, H1, interacts with linker DNA<br/>between nucleosomes and functions in the compaction of chromatin into higher order<br/>structures. This gene is intronless and encodes a replication-dependent histone that is a<br/>member of the histone H1 family. Transcripts from this gene lack polyA tails but instead<br/>contain a palindromic termination element. This gene is found in the large histone gene<br/>cluster on chromosome 6.
