#### **GRIGENE** HNRNPD Rabbit Polyclonal Antibody – TA377164

Background:This gene belongs to the subfamily of ubiquitously expressed heterogeneous nuclear<br/>ribonucleoproteins (hnRNPs). The hnRNPs are nucleic acid binding proteins and they complex<br/>with heterogeneous nuclear RNA (hnRNA). These proteins are associated with pre-mRNAs in<br/>the nucleus and appear to influence pre-mRNA processing and other aspects of mRNA<br/>metabolism and transport. While all of the hnRNPs are present in the nucleus, some seem to<br/>shuttle between the nucleus and the cytoplasm. The hnRNP proteins have distinct nucleic<br/>acid binding properties. The protein encoded by this gene has two repeats of quasi-RRM<br/>domains that bind to RNAs. It localizes to both the nucleus and the cytoplasm. This protein is<br/>implicated in the regulation of mRNA stability. Alternative splicing of this gene results in four<br/>transcript variants.

Synonyms:

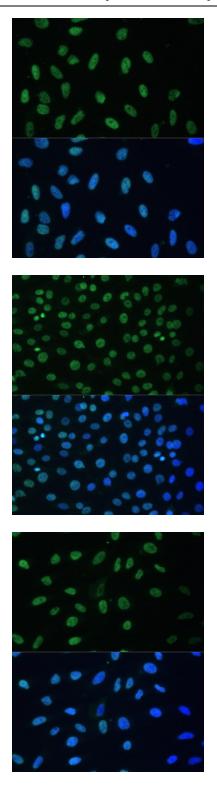

AUF1; AUF1A; hnRNPD0; HNRPD; P37
