Background: Eukaryotic protein kinases are enzymes that belong to a very extensive family of proteins

which share a conserved catalytic core common with both serine/threonine and tyrosine protein kinases. This gene encodes an intestinal serine/threonine kinase harboring a dual phosphorylation site found in mitogen-activating protein (MAP) kinases. The protein localizes

to the intestinal crypt region and is thought to be important in intestinal epithelial cell

proliferation and differentiation. Alternative splicing has been observed at this locus and two

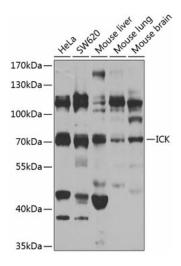

variants, encoding the same isoform, have been identified.
