| Background:             | This gene is the putative transforming gene of avian sarcoma virus 17. It encodes a protein<br>which is highly similar to the viral protein, and which interacts directly with specific target<br>DNA sequences to regulate gene expression. This gene is intronless and is mapped to 1p32-<br>p31, a chromosomal region involved in both translocations and deletions in human<br>malignancies. |
| Synonyms:               | AP-1; AP1; c-Jun; p39  |
