Background: This gene encodes a member of the kinesin family of microtubule-based motor proteins that

function in the positioning of endosomes. This family member can direct mannose-6-phosphate receptor-containing vesicles from the trans-Golgi network to the plasma

membrane, and it is necessary for the steady-state distribution of late

endosomes/lysosomes. It is also required for the translocation of FYVE-CENT and TTC19 from

the centrosome to the midbody during cytokinesis, and it plays a role in melanosome maturation. Alternative splicing of this gene results in multiple transcript variants.
