Q96MU8

Background: This gene encodes a high-affinity dickkopf homolog 1 (DKK1) transmembrane receptor that

> functionally cooperates with DKK1 to block wingless (WNT)/beta-catenin signaling. The encoded protein is a component of a membrane complex that modulates canonical WNT signaling through lipoprotein receptor-related protein 6 (LRP6). It contains extracellular kringle, WSC, and CUB domains. Alternatively spliced transcript variants encoding distinct

isoforms have been observed for this gene.

Synonyms: FLJ31863; KREMEN; KRM1
