GRIGENE Cytokeratin 6B (KRT6B) Rabbit Polyclonal Antibody – TA377916

Background:The protein encoded by this gene is a member of the keratin gene family. The type II
cytokeratins consist of basic or neutral proteins which are arranged in pairs of heterotypic
keratin chains coexpressed during differentiation of simple and stratified epithelial tissues. As
many as six of this type II cytokeratin (KRT6) have been identified; the multiplicity of the
genes is attributed to successive gene duplication events. The genes are expressed with
family members KRT16 and/or KRT17 in the filiform papillae of the tongue, the stratified
epithelial lining of oral mucosa and esophagus, the outer root sheath of hair follicles, and the
glandular epithelia. Mutations in these genes have been associated with pachyonychia
congenita. The type II cytokeratins are clustered in a region of chromosome 12q12-q13.

Synonyms: CK6B; Cytokeratin-6B; K6B; KRTL1; PC2
