#### **GRIGENE** MEK2 (MAP2K2) Rabbit Polyclonal Antibody – TA378249S

Background:The protein encoded by this gene is a dual specificity protein kinase that belongs to the MAP<br/>kinase kinase family. This kinase is known to play a critical role in mitogen growth factor<br/>signal transduction. It phosphorylates and thus activates MAPK1/ERK2 and MAPK2/ERK3. The<br/>activation of this kinase itself is dependent on the Ser/Thr phosphorylation by MAP kinase<br/>kinase kinases. Mutations in this gene cause cardiofaciocutaneous syndrome (CFC<br/>syndrome), a disease characterized by heart defects, cognitive disability, and distinctive facial<br/>features similar to those found in Noonan syndrome. The inhibition or degradation of this<br/>kinase is also found to be involved in the pathogenesis of Yersinia and anthrax. A<br/>pseudogene, which is located on chromosome 7, has been identified for this gene.

Synonyms: FLJ26075; MAPKK2; MEK2; MKK2; PRKMK2
